

The amount of **lumens** produced at a source does not directly correspond with the amount of **footcandles** delivered.

The **F-18** controls/focuses the light energy produced with **proprietary optics** delivering light uniformly to the work surface for **superior visual comfort**.

When it comes to fixture performance: **footcandles delivered** are more important than **lumens produced**

Knowing the difference makes all the difference

FOOTCANDLES DELIVERED:

the amount of working light perceived at the work surface

LUMENS PRODUCED:

visible light emitted at the source

The innovative designs of **energybank** will always prioritize the optimization of the light engine as a system that **delivers maximum footcandles** without compromising performance or longevity.

From 2001 to 2012 we proved 4,000,000 times across 10,000 facilities that there is a disconnect between lumens produced and footcandles delivered.

(*footcandles*)
delivered
